The losses of the arc suppression coil itself are around 1% of the tuning position for new coils. This 1% is included in the 2-4% estimation mentioned before. 1.3 Fault detection sensitivity depending on the tuning position of the arc suppression coil. The setup of the arc suppression coil has an influence on the fault detection sensitivity. Why?

Using lightning energy to extinguish the arc is a new lightning protection method. On this basis, the semi-closed multi-compression tube structures (SMTS) combined with the arc extinguishing structure studied in this paper can suppress the power frequency arc at the initial stage of arc establishment by using the coupling effect of current and gas. Firstly, through the ...

The arc extinguishing mode of neutral grounding via arc suppression coil (ASC) is widely used in the distribution network. With the increasing application of active intervention type arc extinguishing device (AIT-AED), there is a situation that the AIT-AED and the ASC operate in parallel, but the parallel operation

technology of these two devices is not mature.

Abstract: Installing the arc suppression coil (ASC) at the neutral point in the medium-voltage power network is widely applied in the distribution network in China. For the sake of adapting ...

1938 The first stepless adjustable arc suppression coil is build with the plunger core principle. The tuning is done manually with auxiliary equipment to determine the compensation degree. 1950 The first electromechanical resonance controller was built for automatic adjustment of the arc suppression coil. 1981 The first microprocessor controlled

The existing active-type voltage arc suppression methods do not consider the influence of line voltage drop, which leads to the existence of large fault residual current at the fault point for low-resistance grounding fault occurring in the distribution network and affects the reliable extinguishing of the fault arc. In this paper, an active inverter is used to inject a ...

Flexible grounding, that is, the neutral point adopts the grounding mode of small resistance parallel arc suppression coil, which combines the advantages of a resonant system and small resistance grounding, respectively [4]. Arc suppression coil systems can effectively extinguish transient fault arcs to avoid frequent power outages.

The arc suppression coil is an adjustable inductance coil with an iron core, which is installed at the neutral point of a transformer or generator. When a single-phase grounding fault occurs, an inductive current that is approximately equal to the grounding capacitor current but in the opposite direction can be formed.

In distribution networks with arc suppression coil grounding, the fault line can be set as the energy leakage channel of the capacitive current of the entire system. During the period from fault occurrence to the whole action process of arc suppression coil, there is abundant fault information in the transient waves.
