

Researchers devise a method to store iontronic energy in a polymer film based on osmotic effects, achieving high energy and power density. Making salinity gradient energy ...

Artificial spin ices also show promise as reprogrammable magnonic crystals and, with this in mind, we give an overview of the measurements of fast dynamics in these magnetic metamaterials.

Notably, the stacking fault does not cause lattice distortion, but due to the local destruction of the normal periodic arrangement of the crystal, stacking fault energy is introduced to increase the energy of the crystal, which can be applied as an active site for energy storage and conversion systems [22]. GBs are the interfaces between grains ...

High-entropy ceramic dielectrics show promise for capacitive energy storage but struggle due to vast composition possibilities. Here, the authors propose a generative learning approach for finding ...

Photonic crystals (PhCs) influence the propagation of light by their periodic variation in dielectric contrast or refractive index. This review outlines the attractive optical ...

The ever-growing pressure from the energy crisis and environmental pollution has promoted the development of efficient multifunctional electric devices. The energy storage and multicolor electrochromic (EC) characteristics have gained tremendous attention for novel devices in the past several decades. The precise design of EC electroactive materials can ...

The integration of Artificial Intelligence (AI) in Energy Storage Systems (ESS) for Electric Vehicles (EVs) has emerged as a pivotal solution to address the challenges of energy efficiency, battery degradation, and optimal power management. The capability of such systems to differ from theoretical modeling enhances their applicability across various domains. The vast amount of ...

One contribution from the area of crystal structure prediction investigates the possible bulk Cr-Si-N phases of the composition of Cr_2SiN_4 via a cross-methodical approach combining global optimization, data mining, and the Primitive Cell approach for Atom Exchange (PACE) [] the field of the plastic deformation of polycrystalline materials, the use of ...

Metasurfaces acting on electromagnetic fields have emerged as powerful tools that can address all the wave's degrees of freedom: amplitude, phase and polarization. It is especially with respect to polarization that their role is steadily growing: metasurfaces can indeed perform, by design, operations that would usually require very specific, delicate and expensive ...

Adapted with ...

Achieving long-cycle-life, aqueous, dual-electrode-free Zn/MnO₂ batteries with high energy density is challenging. This work introduces a liquid crystal interphase in the electrolytes with soft ...

Aqueous lithium energy storage systems address environmental sustainability and safety issues. However, significant capacity fading after repeated cycles of charge-discharge and during float ...

Photonic crystals are artificial structures with a spatial periodicity of dielectric permittivity on the wavelength scale. This feature results in a spectral region over which no light can propagate within such a material, known as the photonic band gap (PBG). It leads to a unique interaction between light and matter. A photonic crystal can redirect, concentrate, or even trap ...

Gaps in the energy band structure of the crystal lattice create forbidden electron energies in the material. For PhCs, the system of a periodic potential of atoms or molecules is replaced by a periodic dielectric function where different dielectric contrasts of larger ordered structures create similar effects for photons as seen with electrons.

Growing energy demands in modern society while transitioning toward renewable energy sources motivate the development of advanced energy storage devices for both small and large-scale applications. Rechargeable batteries have emerged as one of the leading solutions for powering various everyday technologies, such as electric vehicles, smart ...

Energy storage systems (ESSs) are receiving growing attention as main stream solutions for the widespread use of renewable energies and subsequently as a means of decarbonizing the electrification of society. ... In doing so, artificial intelligence provides an opportunity to better adapt energy storage systems with changing environmental ...

There are countless examples of research attempting to exploit these facets of photonic crystal behavior for improved material design. Here, the role of photonic crystals is reviewed across a ...

Artificial intelligence (AI)-assisted materials design and discovery methods can come to the aid of global concerns for introducing new efficient materials in different applications. ... Accordingly, researchers are looking for fast ways to discover or optimize materials for energy storage applications. ... inorganic crystal structure database ...

Automatic identification of crystal structures and interfaces via artificial-intelligence-based electron microscopy Andreas Leitherer ^{1,6}, Byung Chul Yeo ^{2,6}, Christian H. Liebscher ³ and Luca ...

These applied scientific advances may be feasible by adapting the physics of photonic crystals to materials science and electrochemistry for promising battery and energy storage materials, and ...

Distinct crystal structures, surfaces, and interfaces in bulk as well as nanomaterials play a key role in tailoring desirable properties in many applications, e.g., ...

Ranging from energy harvesting [2] to electrical energy storage [3] (EES), organics present a combination of attractive features [4] like low cost, versatile synthesis routes, lightweight, tailorable properties and production from renewable sources [5, 6]. Therefore, the proper design of novel organic materials with enhanced properties is of ...

A new type of artificial shape-setting energy storage phosphorous building gypsum aggregate (ES-PBGA) was prepared through the vacuum adsorption of paraffin with hardened gypsum as the energy storage phosphorus building gypsum aggregate matrix(ES-PBGAM). ... As shown in Fig. 6 (b) and (f), a certain amount of needle-like AFt crystals were ...

Prediction of crystal structures with desirable material properties is a grand challenge in materials research, due to the enormous search space of possible combinations of elements and their countless arrangements in 3D space. Despite the recent progress of a few crystal structure prediction algorithms, mos Advancing
