Capacity defines the energy stored in the system and depends on the storage process, the medium and the size of the system;. Power defines how fast the energy stored in the system can be discharged (and charged);. Efficiency is the ratio of the energy provided to the user to the energy needed to charge the storage system. It accounts for the energy loss during the ...

When sensible thermal energy storage is considered, the thermal energy storage capacity is calculated over the mass and specific heat of the storage medium. So, increasing the mass of a storage medium increases the heat storage capacity, but this cannot be done continuously due to higher storage volume requirement.
