

What are the components of a flywheel energy storage system?

A flywheel energy storage system consists of bearings, a rotating mass, a motor-generator, and a frequency inverter. Fig. 14.4 shows the main components of a flywheel energy storage system. The design of the components influences the overall efficiency, and can help in reducing power transmission losses.

How does Flywheel energy storage work?

Flywheel energy storage (FES) works by accelerating a rotor (flywheel) to a very high speed and maintaining the energy in the system as rotational energy.

Why do flywheel energy storage systems have a high speed?

There are losses due to air friction and bearingin flywheel energy storage systems. These cause energy losses with self-discharge in the flywheel energy storage system. The high speeds have been achieved in the rotating body with the developments in the field of composite materials.

Are flywheel energy storage systems suitable for commercial applications?

Among the different mechanical energy storage systems, the flywheel energy storage system (FESS) is considered suitable for commercial applications. An FESS, shown in Figure 1, is a spinning mass, composite or steel, secured within a vessel with very low ambient pressure.

How long does a flywheel energy storage system last?

Flywheel energy storage systems have a long working life if periodically maintained (>25 years). The cycle numbers of flywheel energy storage systems are very high (>100,000). In addition, this storage technology is not affected by weather and climatic conditions. One of the most important issues of flywheel energy storage systems is safety.

What machines are used in flywheel energy storage systems?

Three common machines used in flywheel energy storage systems are the induction machine (IM),the variable reluctant machine (VRM),and the permanent magnet machine (PM). For high-power applications,an IM is utilised as it is very rugged,has high torque,and is not expensive.
