

Compressed-air energy storage (CAES) is a way to store energy for later use using compressed air. At a utility scale, energy generated during periods of low demand can be released during peak load periods. [1] A pressurized air tank used to start a diesel generator set in Paris Metro. Le 'CAES', (de l'anglais Compressed Air Energy Storage) est un mode de stockage d'énergie par air comprimé, c'est-à-dire d'énergie mécanique potentielle, qui se greffe sur des turbines à gaz. Comment ça marche ? Dans une turbine à gaz classique, de l'air ambiant est capté et comprimé dans un compresseur à très haute pression (100 à 300 bar).

Compressed air energy storage (CAES) is one of the many energy storage options that can store electric energy in the form of potential energy (compressed air) and can be deployed near central power plants or distribution centers. In response to demand, the stored energy can be discharged by expanding the stored air with a turboexpander generator.

The recent increase in the use of carbonless energy systems have resulted in the need for reliable energy storage due to the intermittent nature of renewables. Among the existing energy storage technologies, compressed-air energy storage (CAES) has significant potential to meet techno-economic requirements in different storage domains due to its long ...

An integration of compressed air and thermochemical energy storage with SOFC and GT was proposed by Zhong et al. [134]. An optimal RTE and COE of 89.76% and 126.48 \$/MWh was reported for the hybrid system, respectively. Zhang et al. [135] also achieved 17.07% overall efficiency improvement by coupling CAES to SOFC, GT, and ORC hybrid system.
