

The idea for pumped hydro storage is that we can pump a mass of water up into a reservoir (shelf), and later retrieve this energy at will--barring evaporative loss. Pumps and turbines (often implemented as the same physical unit, actually) can be something like 90% efficient, so the round-trip storage comes at only modest cost.

With compressed air storage, air is pumped into an underground hole, most likely a salt cavern, during off-peak hours when electricity is cheaper. When energy is needed, the air from the underground cave is released back up into the facility, where it is heated and the resulting expansion turns an electricity generator.

Ocean energy storage systems use the natural properties of the ocean for energy storage. They are not-so-distant cousins to pumped hydro (PHS) and compressed air energy storage (CAES) systems on land. There are two main types of ocean energy storage: underwater compressed air energy storage (UCAES) and underwater pumped hydro storage (UPHS).

Two main advantages of CAES are its ability to provide grid-scale energy storage and its utilization of compressed air, which yields a low environmental burden, being neither toxic nor flammable.

Although the initial investment cost is estimated to be higher than that of a battery system (around \$10,000 for a typical residential set-up), and although above-ground storage increases the costs in comparison to underground storage (the storage vessel is good for roughly half of the investment cost), a compressed air energy storage system offers an almost ...

Figure 2 The illustration of PHES (Energy Storage Sense, 2018) 1.2.2 Compressed Air Energy Storage (CAES) An alternative method is CAES (Compressed Air Energy Storage) which has the second most installed capacity after PHES (IVA, 2015). As in the case of most methods of energy storage, CAES also employs the use of potential energy.

When the compressed air regulating pressure is 1-3.5 MPa, the increase in pressure of compressed air leads to an increase in the power and stored energy of the CAES system. However, the equivalent head of compressed air reduces the head of pumped storage, leading to a decrease in the power and energy of the UPSH system.

Compressed air energy storage (CAES) is one of the important means to solve the instability of power generation in renewable energy systems. To further improve the output power of the CAES system and the stability of the double-chamber liquid piston expansion module (LPEM) a new CAES coupled with liquid piston energy storage and release (LPSR-CAES) is proposed.
