#### How is a power system analysis done?

The analysis is done with PowerWorld and is supplemented with MatLab calculations. The students were provided information concerning a small (seven bus, two generator) powersystem. They were required to assemble all of the information into tables, both in actual values well as in per unit on a common base, before beginning the analysis.

A new method for DLF in radial active distribution networks is proposed based on the zooming algorithm and does not require to calculate the bus-injection to branch-current (BIBC) matrix which reduces the computational burden and helps to decrease the solution time.

This method utilises real-time synchro-phasor measurements on N boundary buses and online state estimation on the load area to analyse n-1 sensitivities for equivalent transfer admittances and power flows by means of a modified line outage distribution factor.
