How do energy storage electric boilers support combined heat and power plants?

Models for energy storage electric boilers and control strategies were established to support combined heat and power plants in meeting their heat demand while reducing their electrical output, thus increasing the utilization of wind power.

What is the thermal stratification effect in electric boiler storage tanks?

The modeling of electric boilers can be more complex, taking the thermal stratification effect into account. Thermal stratification in electric boiler storage tanks indicates different temperature levels in several layers inside the tank. In energy system models, many approaches are used to address the thermal stratification effect.

How efficient is a thermal storage system?

The equivalent round-trip efficiency of the entire process is 85.17%, which is a high level for energy storage systems. The efficiency is achieved because of the appropriate match between the heat sources and the thermal storage media. To illustrate the thermal performance of the integrated system, an exergy flow Sankey diagram is shown in Fig. 7.

How much energy does a boiler use a year?

In , it is noted that boilers are implemented in the calculation of the use of 500 h with a full load per year. The conversion of electrical energy into thermal energy occurs with almost 100% efficiency. However, from an energetic point of view, this technology must be justified by its systemic advantages.

Why are electric boilers used in central heating systems?

Thus, the use of electric boilers in central heating systems is primarily due to the demand for auxiliary services, and not for the demand for heat. Electrode boilers have been used in Europe for more than 70 years. It was very popular in the 1960s, especially in countries with significant hydropower resources (for example, Norway) [11,12].

What is the maximum power response of electrode boilers?

As shown in Figure 15, the power response curve of electrode boilers indicates that the maximum power response of conventional control electrode boilers reaches 0.0031 p.u., while the maximum power response of electrode boilers with fuzzy control is 0.0028 p.u.
