Flywheel energy storage devices turn surplus electrical energy into kinetic energy in the form of heavy high-velocity spinning wheels. To avoid energy losses, the wheels are kept in a frictionless vacuum by a magnetic field, allowing the spinning to be managed in a way that creates electricity when required.

A Carnot battery first uses thermal energy storage to store electrical energy. And then, during charging of this battery electrical energy is converted into heat and then it is stored as heat. Now, upon discharge, the heat that was previously stored will be converted back into electricity. This is how a Carnot battery works as thermal energy ...

Grid-scale battery energy storage ("storage") contributes to a cost-efficient decarbonization process provided that it charges from carbon-free and low-cost renewable sources, such as wind or solar, and discharges to displace dirty and expensive fossil-fuel generation to meet electricity demand. <sup>1</sup> However, this ideal assumption is not always feasible ...
