Keywords: low-inertia systems, energy storage, inertial control, primary control, frequency stability, power system design 1 INTRODUCTION Planning, design, and operation of ac power systems (ACPSs) are becoming more involved. For instance, conversion from primary sources and storage is performed using not only synchronous machines (SMs)

Hence, mechanical energy storage systems can be deployed as a solution to this problem by ensuring that electrical energy is stored during times of high generation and supplied in time of high demand.

SMA supplied critical components for the project, including 62 medium-voltage power stations boasting 333MWs of inertia and 84 MVA of SCL. Collaborating with industry leaders like Wärtsilä and H& MV, Zenob? ensured the successful implementation of the project, setting new benchmarks in grid stability and renewable energy integration.
