1. Introduction. Next-generation batteries with high energy density are urgently needed for the development of electric vehicles and smart grid storage [1].The lithium-oxygen (Li-O₂) battery is a promising candidate because of its extremely high specific energy density (3500 Wh kg⁻¹), which is approximately tenfold higher than that of lithium-ion batteries [2], [3], [4], [5].

In the early 1990s, Sony launched the first commercial lithium ion battery (LIB), which achieved great success in energy storage systems. The current commercially used insertion anode, graphite, is approaching its capacity limit (~372 mAh g⁻¹), and is inadequate to satisfy the ever-increasing energy demand for power grids and large-scale ...

Thermal runaway in lithium batteries results in an uncontrollable rise in temperature and propagation of extreme fire hazards within a battery energy storage system (BESS). It was once thought to be impossible to stop a cascading thermal runaway event, until now with Fike Blue(TM) .

Lead-acid batteries with aqueous-based systems have low costs and good safety, but suffer from low energy density, have negative environmental implications, and exhibit poor cycling stability (< 500 cycles) [7,8]. Hence, alternative energy storage systems with high performance, low cost, and high safety are greatly desired.

Due to high power density, fast charge/discharge speed, and high reliability, dielectric capacitors are widely used in pulsed power systems and power electronic systems. However, compared with other energy storage devices such as batteries and supercapacitors, the energy storage density of dielectric capacitors is low, which results in the huge system volume when applied in pulse ...
