1. Introduction. A microgrid is a collection of energy resources on a common network. These resources include generation, conversion, loads and storage devices (Lasseter, 2002). The model of centralized generation is gradually being replaced by a distributed generation model (Nigim & Lee, 2007). The emerging technologies in renewable and distributed generation ...

When renewable energy sources are coupled with additional energy sources, hybrid renewable energy systems (HRESs) are developed. Consumer demand for energy is not uniformly spread throughout time, resulting in phasing issues between energy produced and energy used (Sun et al., 2020). The grid"s stability is determined by the balance of output and ...
