Compared to batteries, flywheels have five to ten times more power density, allowing them to store comparable amounts of power at much smaller volumes. Similar to compressed air energy storage and pumped hydro, flywheel energy storage has a long lifespan and the capacity is similarly limited to the size of the flywheel system.

The formula for calculating the kinetic energy of a flywheel is as follows:  $KE = \frac{1}{2} * I * \omega^2$ . KE is the kinetic energy, I is the moment of inertia, and  $\omega$  is the angular velocity. Advantages of Flywheel Energy Storage: High Power Density: FES has a very high power density, meaning it can quickly deliver much energy.
