Can metal powder be used as a primary energy source?

Bergthorson and his colleagues' idea is not to use metal powders as a primary energy source, but as a way to store, transport and trade it as a zero-carbon fuel. If this sounds similar to the idea of a hydrogen economy, it is.

Is iron powder a renewable fuel?

This review examines iron powder as a renewable fuel, a recyclable fuel, and a sustainable energy source that has been offered to date. It is a renewable fuel because of its ability to be recycled and stored.

Is iron powder a sustainable fuel source?

In light of the existing body of research and the emerging importance of iron powder as a sustainable energy carrier, it is evident that investigations into the renewability of iron powder as a fuel source, particularly within the context of a carbon-neutral future in the dry cycle, have been notably scarce.

Could metal powder be a zero-carbon fuel?

He and colleagues at McGill and at the European Space Agency published this week in *Applied Energy* a study outlining how metal powder could serve as a zero-carbon fuel to power transportation and the grid. "Aluminum powder has long been known to be a very energetic material," says Bergthorson.

Can iron powder be used as a source of energy?

Bergthorson proposes that instead iron powder would be distributed as a means to drive power plants, ships, locomotives and even cars. "Storing energy will be an important part of the green-energy equation," says Bergthorson. And for this purpose, metal powders have an advantage over hydrogen and batteries.

A recent proposal by Bergthorson [1] considers metal powder as a dense energy carrier (DEC). In a metal DEC cycle, energy is stored in such a metal powder. The complete cycle is shown in Fig. 1. At the power generation plant, metal powder is burned to generate heat which is converted to electricity. The combustion of the metal generates

Iron Power represents a groundbreaking approach to energy production. By harnessing the power of iron as a fuel source, we are pioneering a sustainable alternative to traditional energy sources. This innovative technology not only promises to offer CO<sub>2</sub>-free energy, but also offers a reliable and efficient solution to meet the world's growing energy needs.

**Powder production.** After atomisation, powders are traditionally collected in a cyclone system. These powders are typically non-passivated. The transfer of these non-passivated powders from the atomisation cyclone to ancillary process containers is considered to present a high risk of thermal runaway, which may require breaking of the inert gas seal and ...
