maximize the peak-demand reduction by using energy storage in an on-peak period. First note that the volume charge prices are much lower in off-peak periods, so we had better fully charge the storage system then. Second, the on-peak periods of neighbour users often coincide. Thus, recharging may increase the cumulative

The load flow is carried out with peak load shaving where the state of charge (SOC) of the batteries is not allowed to lower beyond a certain value during sunshine hour. The feed-in-tariff ...

In recent years, ToU Tariffs based on peak load pricing have been introduced and resulted to be among the most efficient Load Management techniques, beneficial for both the end-users and the supplier. ... 1. Introduction1.1. General problem and motivation. Electricity demand, or the energy load, varies over time depending on the season and the load composition, thus, meeting time-varying demand, especially in peak periods, can present a key challenge to electric power utilities [1], [2].Variations in end-customers" daily consumption profiles have created a notable ...

The results show that, with the combined approach, both the local peak load and the global peak load can be reduced, while the stress on the energy storage is not significantly increased. The peak load at the point of common coupling is reduced by 5.6 kVA to 56.7 kVA and the additional stress for the storage system is, on average, for a six ...

Typical control strategies for energy storage systems target a facility"s peak demand (peak clipping (PC) control strategy) and/or daily load shifting (load shifting (LS) control strategy). In a PC control strategy, the energy storage systems" dispatch is focused on peak demand reduction and therefore charges and discharges less.

Therefore, these methods cannot be applied in engineering projects in Ningxia. Reference [32] only considers the use of energy storage and load-side flexible resources for peak-shaving, but does not consider the
