What causes large-scale lithium-ion energy storage battery fires?

Conclusions Several large-scale lithium-ion energy storage battery fire incidents have involved explosions. The large explosion incidents, in which battery system enclosures are damaged, are due to the deflagration of accumulated flammable gases generated during cell thermal runaways within one or more modules.

Can commercial energy storage systems cause explosions?

It is notable that all examples plotted in Figure 5 lie well above the partial volume deflagration band, indicating that energy densities in commercial energy storage systems are sufficiently high to gener- ate explosions in the event of thermal runaway failure.

What is an example of a battery explosion?

6 October 2021 Battery Energy Storage Systems Explosion Hazards McMicken BESS in Surprise, Arizona The final example is the McMicken BESS incident in Surprise, Ari- zona. In this incident, a single battery rack went into thermal run- away, filling the container with flammable gas.

Are battery storage systems causing fires & explosions?

Unfortunately, a small but significant fraction of these systems has experienced field failures resulting in both fires and explosions. A comprehensive review of these issues has been published in the EPRI Battery Storage Fire Safety Roadmap (report 3002022540), highlighting the need for specific efforts around explosion hazard mitigation.

What are stationary energy storage failure incidents?

Note that the Stationary Energy Storage Failure Incidents table tracks both utility-scale and C&I system failures. It is instructive to compare the number of failure incidents over time against the deployment of BESS. The graph to the right looks at the failure rate per cumulative deployed capacity, up to 12/31/2023.
