How are grid applications sized based on power storage capacity?

These other grid applications are sized according to power storage capacity (in MWh): renewable integration, peak shaving and load leveling, and microgrids. BESS = battery energy storage system, h = hour, Hz = hertz, MW = megawatt, MWh = megawatt-hour.

Should energy storage power stations be scaled?

In addition, by leveraging the scaling benefits of power stations, the investment cost per unit of energy storage can be reduced to a value lower than that of the user's investment for the distributed energy storage system, thereby reducing the total construction cost of energy storage power stations and shortening the investment payback period.

Referring to the battery energy storage capacity when compared to the beginning of life of performance:
BESS: Battery Energy Storage System: A complete system consisting of AC drive, battery bank, and control hardware and software: PMS: Power Management System: A system to control the power plant at a facility.

Due to the dual characteristics of source and load, the energy storage is often used as a flexible and controllable resource, which is widely used in power system frequency regulation, peak shaving and
