The nominal working pressure inside a hydrogen storage tank ranges from 35 MPa to 70 MPa [4]. While for
reliable operation, it is critical to keep the fuel cell stack pressure between 0.1 MPa and 0.3 MPa [5, 6]. As a
result, the demand for decompression processes between the storage tank and the fuel cell stack has prompted
researchers to investigate ...

Stop valves are designed to control the flow of water by either stopping it completely or allowing it to pass
through. These valves enable easy maintenance, repair, or modification of the plumbing system without the
need to drain it entirely, providing a convenient shut-off point in case of leaks or emergencies. Stop valves
ensure precise control over water flow, enhancing the safety and ...

diverted to the cooling system in the three-way valve or to drain in the two-way
 version. As fluid temperature continues to increase, more flow is diverted.
 When the thermostat is in a fully stroked condition, all fluid flow is directed to
 the cooling system in the three-way valve or to drain in the two-way version.
