The nominal working pressure inside a hydrogen storage tank ranges from 35 MPa to 70 MPa [4]. While for reliable operation, it is critical to keep the fuel cell stack pressure between 0.1 MPa and 0.3 MPa [5, 6]. As a result, the demand for decompression processes between the storage tank and the fuel cell stack has prompted researchers to investigate ...

Stop valves are designed to control the flow of water by either stopping it completely or allowing it to pass through. These valves enable easy maintenance, repair, or modification of the plumbing system without the need to drain it entirely, providing a convenient shut-off point in case of leaks or emergencies. Stop valves ensure precise control over water flow, enhancing the safety and ...
