Can fuel cells store energy?

Fuel cells cannot store energy in the way a battery does but it can be stored as hydrogen. In some applications, such as stand-alone power plants based on discontinuous sources such as solar or wind power, they can potentially be combined with electrolyzers and storage systems to form an energy storage system.

What does a fuel cell do?

A fuel cell is a galvanic cell that converts the chemical reaction energy of a continuously supplied fuel and an oxidizing agent into electrical energy. A fuel cell is not an energy storage device but a converter. The energy is supplied in a chemically bound form with the fuel.

What is a fuel cell based energy storage system?

A fuel cell-based energy storage system allows separation of power conversion and energy storage functions enabling each function to be individually optimized for performance, cost or other installation factors. This ability to separately optimize each element of an energy storage system can provide significant benefits for many applications.

How is hydrogen stored in a fuel cell?

The hydrogen is stored while the oxygen can either be stored, suitable for remote or extraterrestrial applications, or vented to the ambient air. When power is needed, the hydrogen is simply supplied to the fuel cell and electrical power is produced.

What types of fuel cells are available?

Fuel cells for portable, backup, automotive, or stationary power applications have been demonstrated, and there are some fuel cells commercially available in these categories. DMFCs and PEMFCs are often used for portable applications. The emergency power supply is often provided by PEM fuel cells with pressurized hydrogen storage.

Can consolidated reversible fuel cells provide long-term energy storage?
