#### What is grid-scale storage?

Grid-scale storage refers to technologies connected to the power grid that can store energy and then supply it back to the grid at a more advantageous time - for example, at night, when no solar power is available, or during a weather event that disrupts electricity generation.

How can energy storage make grids more flexible?

Energy storage is one option to making grids more flexible. An other solution is the use of more dispatchable power plants that can change their output rapidly, for instance peaking power plants to fill in supply gaps.

### Why is grid-scale battery storage important?

Grid-scale storage, particularly batteries, will be essential to manage the impact on the power gridand handle the hourly and seasonal variations in renewable electricity output while keeping grids stable and reliable in the face of growing demand. Grid-scale battery storage needs to grow significantly to get on track with the Net Zero Scenario.

Which energy storage technologies are suitable for grid-scale applications?

Numerous energy storage technologies (pumped-storage hydroelectricity, electric battery, flow battery, flywheel energy storage, supercapacitor etc.) are suitable for grid-scale applications, however their characteristics differ.

The 2020 Cost and Performance Assessment provided installed costs for six energy storage technologies: lithium-ion (Li-ion) batteries, lead-acid batteries, vanadium redox flow batteries, pumped storage hydro, compressed-air energy storage, and hydrogen energy storage.

At present, the most common solutions for grid balancing are power generation based on natural gas and pumped hydro storage (PHS), which guarantee the flexibility needed for the grid. Unfortunately, both technologies have their limitations: Natural gas is not only imported to Europe, it is not climate neutral either, while PHS is not an option ...

Developing additional investment scenarios that consider alternative solutions beyond traditional power grid upgrades (for instance, storage, optimal location in the grid for renewable additions, and advanced inverters) and have different target functions such as optimizing for quality of service or for capital expenditure (capex).
