

Thermal energy storage (TES) is one of the most promising technologies in order to enhance the efficiency of renewable energy sources. TES overcomes any mismatch between energy generation and use in terms of time, temperature, power or site [1]. Solar applications, including those in buildings, require storage of thermal energy for periods ranging from very ...

The integration of thermal energy storage (TES) systems with GSHPs can mitigate these issues by balancing energy supply and demand, providing flexibility to meet heating and cooling demand during peak hours, preserving energy during off-peak hours, and ...

In light of the pressing need to address global climate conditions, the Paris Agreement of 2015 set forth a goal to limit average global warming to below 1.5 °C by the end of the 21st century [1]. Prior to the United Nations Climate Summit held in November 2020, 124 countries had pledged to achieve carbon neutrality by 2050 [2]. Notably, China, as the world's ...

of a ground source direct cooling system and water storage tank system can strengthen their advantages, optimize their performance, and implement the system's efficiency and energy savings (Zhao 2014). The objective of this study is to introduce an applied case study of the ground source direct cooling system integrated with a water storage ...

The integrated use of multiple renewable energy sources to increase the efficiency of heat pump systems, such as in Solar Assisted Geothermal Heat Pumps (SAGHP), may lead to significant benefits in terms of increased efficiency and overall system performance especially in extreme climate contexts, but requires careful integrated optimization of the ...

To alleviate the energy crisis and improve energy efficiency within the global low-carbon movement [1], different types of distributed energy resources such as photovoltaic [2], wind power [3] and thermoelectric generator [4] have been extensively developed and deployed [5]. Energy storage system has also gained widespread applications due to their ability to ...

Increasing the penetration of renewable electricity while ensuring grid stability requires low-cost, high roundtrip efficiency energy storage solutions. GLIDES (Ground-Level Integrated Diverse Energy Storage) is a novel mechanical electricity storage concept which hybridizes the existing compressed-air (CAES) and pumped-storage (PSH) approaches to energy storage.

In this work, a novel Ground-Level Integrated Diverse Energy Storage (GLIDES) system which can store energy via input of electricity or heat and deliver dispatchable electricity is presented [1]. The proposed

system is low-cost and hybridizes compressed air and pumped-storage approaches that will allow for the off-peak storage of intermittent renewable energy for ...

In this context, integrated energy systems (IES), by integrating multi-energy and distributed power sources such as cooling, heat, electricity and hydrogen, can effectively improve the efficiency of energy use, realise the advantages of complementarity between multiple energy sources, improve the flexibility of system operation and reduce the ...

In this paper, a novel compressed air energy storage system is proposed, integrated with a water electrolysis system and an H₂-fueled solid oxide fuel cell-gas turbine-steam turbine combined cycle system the charging process, the water electrolysis system and the compressed air energy storage system are used to store the electricity; while in the ...

Combined Cooling Heating and Power (CCHP) units are used to provide electricity, heat and cold energy in the integrated energy system (IES), and GSHP is gradually introduced as an important supply source of heat and cold (J. J. Wang et al., 2018; Jo et al., 2021). The participation of GSHP in energy supply will optimize the energy scheduling of IES, ...

HEG will be integrated into the controls and energy storage systems of both the vehicle and buildings. Ground-Level Integrated Diverse Energy Storage In this task, ORNL will explore energy storage methods for localized power generation that will supplement or substitute batteries, including a novel technology under development called Ground-Level

o Introduce a novel energy storage solution with the following features: - Frequency modulation - Fine load following capabilities - Fast response time - Achieve $\leq \$200/\text{kWh}$ for grid storage

Numerical study on ground source heat pump integrated with phase change material cooling storage system in office building: 2015 [45] Cooling: ... Thermo-economic optimization of an ice thermal energy storage system for air-conditioning applications: 2013 [68] Cooling: Simulation: Air: R134a / 3-5 °C; Ice, 1513 kWh:

This paper proposes a solution to cover residential buildings' electrical and thermal energy demand by integrating renewable energy systems and using a developed efficient energy storage system. The Renewable Energy System for Residential Building Heating and Electricity Production (RESHeat) system enables an advanced 100 % RES system on ...

A novel energy efficient storage system based on near isothermal compressed air energy storage concept, named as Ground-Level Integrated Diverse Energy Storage (GLIDES) is analyzed for integration ...

CAES, a long-duration energy storage technology, is a key technology that can eliminate the intermittence and fluctuation in renewable energy systems used for generating electric power, which is expected to accelerate

renewable energy penetration [7], [11], [12], [13], [14]. The concept of CAES is derived from the gas-turbine cycle, in which the compressor ...

GLIDES (Ground-Level Integrated Diverse Energy Storage) is a novel mechanical electricity storage concept which hybridizes the existing compressed-air (CAES) and pumped-storage ...

This study introduces an energy scheduling optimization model tailored for building integrated energy systems, encompassing elements like gas turbines, wind and solar modules, ground source heat ...

The results show that the integrated energy system with a ground source heat pump and seasonal thermal energy storage device can effectively reduce the cost of the operation planning by 9.1 %. The cost of purchased energy and carbon emissions have also been reduced by 23.4 % and 12.6 %, respectively. ... To analyze the effect of the seasonal ...

Through research and demonstration, INL advances integrated energy generation, storage and delivery technologies needed for a net-zero future. The integrated systems approach is a marked change from traditional energy system designs typically focused on single generation sources to support a single energy demand (e.g., a nuclear plant that ...

This paper utilizes distributed ground source heat pump heat storage systems in integrated energy systems to simultaneously improve the utilization efficiency of wind energy and solar energy for the first time. Moreover, the carbon capture and storage technology in integrated energy systems is considered to store excess CO₂ in geological layer ...

In this work, a novel Ground-Level Integrated Diverse Energy Storage (GLIDES) system which can store energy via input of electricity or heat and deliver dispatchable electricity is presented [1].

A new registration category, the Integrated Resource Provider (IRP), which would allow storage and hybrids to register and participate in a single registration category rather than under two different categories. Clarity for scheduling obligations that apply to different configurations of hybrid systems.

To quantify and estimate market potential for a recently developed Ground-Level Integrated Diverse Energy Storage (GLIDES) technology, the first operation model is developed for this ...

The applications of energy storage systems have been reviewed in the last section of this paper including general applications, energy utility applications, renewable energy utilization, buildings and communities, and transportation. ... Design micro grid system with SMES integrated system of capacity 1.2 MW for a micro grid system [65] Reduce ...

Batteries have high energy densities and are the primary technology of choice for small-scale energy storage.

Compressed air energy storage (CAES) is another large-scale energy storage technology, but there are few plants deployed worldwide. They suffer from their low round trip efficiency (RTE) due to the use of high-pressure air compressors.

Electric vehicles (EVs) play a major role in the energy system because they are clean and environmentally friendly and can use excess electricity from renewable sources. In order to meet the growing charging demand for EVs and overcome its negative impact on the power grid, new EV charging stations integrating photovoltaic (PV) and energy storage ...

The results show that the integrated energy system with a ground source heat pump and seasonal thermal energy storage device can effectively reduce the cost of the operation planning by 9.1 %. The cost of purchased energy and carbon emissions have also been reduced by 23.4 % and 12.6 %, respectively. ... simulation results demonstrate the ...

Integrated energy systems combine nuclear, renewable, and fossil energy sources to create systems that can lead to energy independence, economic competitiveness, and a more reliable electrical grid. ... Energy storage is a crucial component when integrating renewable energy resources with the electrical grid. Batteries allow for electricity to ...

Oak Ridge National Laboratory, in partnership with Georgia Tech and IntelliChoice Energy, will integrate its Ground-Level Integrated Diverse Energy Storage (GLIDES) system with HVAC systems to provide efficient building-integrated electrical and thermal energy storage. This system enables smarter building-grid integration, as well as the use of ...
