Conventional capacitors usually possess small capacitances in the range of 10^{-6} - 10^{-2} F such as the 50 mF capacitance capacitor (Fig. 1a, b), meaning that even if U can be charged to 100 V, energy capacities can only reach 2500 J (~ 0.7 Wh) for this capacitor. Alternatively, the capacitance of supercapacitors can easily reach greater than 100 F.
