Energy / generation services. Utility-scale storage refers to technologies connected to the power grid that can store energy and then supply it back to the grid at a more advantageous time - for example, at night, when no solar power is available, or during a weather event that disrupts electricity generation.

Simply put, energy storage allows an energy reservoir to be charged when generation is high and demand is low, then released when generation diminishes and demand grows. Filling in the gaps. Short-term solar energy storage allows for consistent energy flow during brief disruptions in generators, such as passing clouds or routine maintenance.

A battery energy storage system (BESS) is a storage device used to store energy for later use. A BESS can be charged when local electricity production is high or electricity prices are low and then discharged to power other devices or fed back into the grid during high price periods.

Level 3 charging stations are also known as DC fast charging stations. They can provide a DC charge to an EV"s battery much faster than the AC charge provided by level 1 and 2 charging stations. Level 3 charging stations can provide a charging rate of up to 350 kW, which can charge an EV"s battery to 80% capacity in as little as 30 minutes.
