PV technology integrated with energy storage is necessary to store excess PV power generated for later use when required. Energy storage can help power networks withstand peaks in demand allowing transmission and distribution grids to operate efficiently.

A solar module comprises six components, but arguably the most important one is the photovoltaic cell, which generates electricity. The conversion of sunlight, made up of particles called photons, into electrical energy by a solar cell is called the 'photovoltaic effect'; - hence why we refer to solar cells as 'photovoltaic', or PV for short.
