Transportation and storage represent relatively small energy demand. Though storage of LNG is more energy demanding than storage of gaseous NG, it can be offset by the lower energy demand for long distance transportation of LNG as could be seen Fig. 8. The boil-off makes LNG generally unsuitable for long-term (more than a few weeks) energy storage.

Four equations of state are applied to nitrogen gas, and their predictions are compared to the p-v-T data published by the National Bureau of Standards (NBS). The superiority of the Benedict-Webb-Rubin (BWR) equation of state in the range of interest in hydraulic accumulators is demonstrated. This equation is then used to develop thermodynamic functions, charts, and ...

The Three Gorges Dam in China; the hydroelectric dam is the world's largest power station by installed capacity. A hydropower resource can be evaluated by its available power. Power is a function of the hydraulic head and volumetric flow rate. The head is the energy per unit weight (or unit mass) of water. [5]

Most U.S. hydropower facilities have dams and storage reservoirs. Pumped-storage hydropower facilities are a type of hydroelectric storage system where water is pumped from a water source up to a storage reservoir at a higher elevation. The water is released from the upper reservoir to power hydro turbines located below the upper reservoir.
