

The results suggest that engineering the element-specific damping of materials can open up new classes of materials that exhibit low-energy, ultrafast HI-AOS. Ultrafast control of the magnetization in ps timescales by fs laser pulses offers an attractive avenue for applications such as fast magnetic devices for logic and memory.

\$begingroup\$ It's clear right off the bat that the equation is missing something, because the inductor elements are not considered at all. Consider this technique for efficient analysis in lieu of writing differential equations; it scales very well to the three storage elements in your design. \$endgroup\$ -
