

Pulsed power generation using solid-state linear transformer driver (LTD) with inductive energy storage has been experimentally studied. This is a feasibility study in order to explore this new ...

Considering the above requirements, there are several basic concepts that can be used for high-voltage pulse generation. The key idea is that energy is collected from some primary energy source of low voltage, stored temporarily in a relatively long time and then rapidly released from storage and converted in high-voltage pulses of the desirable pulsed power, as ...

An inductive energy storage device [6] in combination with trigger-less ignition methods [7] was implemented. This configuration presents many benefits, such as a decrease in the size of a thruster, a decrease in the operating voltage required, and no need of an igniter. Most importantly, the VAT is also suitable for use in microsatellites or a ...

There have already a lot of circuit topologies for pulsed power generators using semiconductor switches. In this article, a novel circuit topology concept that can generate bipolar pulses based on linear transformer driver (LTD) topology is presented. Different from traditionally capacitive energy storage (CES) method, we utilize magnetic core as inductive energy storage ...

Pulsed power generation using solid-state linear transformer driver (LTD) with inductive energy storage has been experimentally studied. This is a feasibility study in order to explore this new approach by proving its operation principle and demonstrating its typical performance. Magnetic cores in LTD modules are used as intermediate energy storage from ...

It employs an inductive energy storage and opening switch power conditioning techniques with high energy density capacitors as the primary energy store. The energy stored in the capacitor bank is transferred to an air cored storage inductor in 5.5 ms through wire fuses. By optimizing the exploding wire parameters, a compact, robust, high ...

to changing the method of energy storage. Regarding energy storage, the two most commonly used methods are capacitive energy storage (CES) and inductive energy storage (IES) [9], [12], [13]. By utilizing these energy storage methods, a variety of circuit topologies can be constructed g. 1 shows three circuit

The initial starting voltage spike as well as the energy to operate the vacuum arc are generated by a low mass (<300 g) inductive energy storage PPU which is controlled using +5 V level signals. The thrust-to-power ratio has been estimated to reach up to 20 mN/W. The vacuum arc thruster was tested at the Jet Propulsion Laboratory using W as ...

A new type of vacuum arc thruster in combination with an innovative power processing unit (PPU) has been developed that promises to be a high efficiency (~15%), low mass (~100 g) propulsion system for micro- and nanosatellites. This thruster accelerates a plasma that consists almost exclusively of ions of the cathode material and has been operated ...

Solid-state Marx generator circuits have been widely studied in recent years. Most of them are based on capacitive energy storage (CES), with the basic principle of charging in parallel and discharging in series. In this article, we propose a solid-state Marx circuit using inductive energy storage, where inductors play the role of principal energy storage element. ...

Two methods of output voltage adding using pulse forming lines (PFLs) have been studied and compared. Both methods use inductive energy storage (IES) instead of traditional capacitive energy storage (CES), which means that the PFLs are charged by current instead of voltage. One of the methods (Type A) used an additional transmission-line-transformer (TLT) to achieve the ...

During this time, the energy stored in  $\frac{1}{2} L I_{\text{open}}^2$  (the storage capacitor,  $E_L = L I_{\text{open}}^2$  is the maximum current through the semiconductor opening switch), is partially transferred to the circuit inductance  $L_0$  (inductive energy storage). For the conditions in Fig. 9,  $I_{\text{open}} = 18$  kA, and 10% energy stored in  $C_0$  is transferred to the inductive storage.

Inductors are components that store energy in magnetic fields, with the energy storage capacity determined by inductance and the square of the current. This principle is crucial for the design ...

The use of inductive energy storage requires a current interrupter, or "opening" switch, to divert current into the load. A mechanical switch employing sliding electrical contacts was built and tested in an inductive energy storage circuit. The switch has successfully commutated

By adopting a simple inductive energy storage (IES) circuit [7] and the "triggerless" ignition method [8], the mass of the propulsion system can be decreased to less than 200 g, with a specific impulse of  $>1000$  s and a power level ...

The purpose of an opening switch is simply to stop the flow of current in the circuit branch containing the switch and to accomplish current interruption, the opening switch must force the current to transfer from the switch to a parallel circuit branch and then withstand the voltage generated by the current flowing through the load. The purpose of an opening switch is simply ...

3. Energy-storing loading Adequate strength and consistent with other side and load tolerance with initial-level energy storage exercise (ie, minimal pain during exercise and pain on load tests returning to baseline within 24 hours) Progressively develop volume and then intensity of relevant energy-storage exercise to replicate demands of sport 4.

The work done in time  $dt$  is  $L i \frac{di}{dt} = L i di$  where  $di$  is the increase in current in time  $dt$ . The total work done when the current is increased from 0 to  $I$  is  $\int_0^I L i di = \frac{1}{2} L I^2$ , (10.16.1) (10.16.1)  $\frac{1}{2} L I^2$ , and this is the energy stored in the inductance. (Verify ...

Both methods use inductive energy storage (IES) instead of traditional capacitive energy storage (CES), which means that the PFLs are charged by current instead of voltage. One of the methods (Type A) used an additional transmission-line-transformer (TLT) to achieve the output voltage adding from multiple PFLs, while the other method (Type B ...

The standard inductive energy storage system, Fig. 5, is used to supply power in the form of a large single pulse or a train of high power pulses. Energy is transferred from the inductive store to the load each time the opening switch operates, Fig. 6. Inductive energy storage systems are discussed in considerable detail in

Abstract: The all-solid-state inductive energy storage pulse forming line modulator is a brand-new solution to achieve a high repetition rate, high voltage gain, and short pulse output. However, due to the non-ideal dynamic characteristics of the switch and the fixed physical space size of the transmission line, it's difficult to realize the generation and control of high-voltage short pulses.

An inductive energy storage switch system for the destruction of solid materials is reported. This is based on creating a pulsed electric breakdown in the solid dielectric, which then propagates in the specimen. This scheme provides a higher destruction effectiveness compared to a capacitive energy storage system. The higher energy efficiency is attributed to a ...
