Why should you use an inductor for energy storage?

Because the current flowing through the inductor cannot change instantaneously, using an inductor for energy storage provides a steady output current from the power supply. In addition, the inductor acts as a current-ripple filter. Let's consider a quick example of how an inductor stores energy in an SMPS.

How do inductors store energy?

In conclusion, inductors store energy in their magnetic fields, with the amount of energy dependent on the inductance and the square of the current flowing through them. The formula  $W = \frac{1}{2} L I^2$  encapsulates this dependency, highlighting the substantial influence of current on energy storage.

What is the theoretical basis for energy storage in inductors?

The theoretical basis for energy storage in inductors is founded on the principles of electromagnetism, particularly Faraday's law of electromagnetic induction, which states that a changing magnetic field induces an electromotive force (EMF) in a nearby conductor.

What is the rate of energy storage in a Magnetic Inductor?

Thus, the power delivered to the inductor  $p = v \cdot i$  is also zero, which means that the rate of energy storage is zero as well. Therefore, the energy is only stored inside the inductor before its current reaches its maximum steady-state value,  $I_m$ . After the current becomes constant, the energy within the magnetic becomes constant as well.

What are some common hazards related to the energy stored in inductors?

Some common hazards related to the energy stored in inductors are as follows: When an inductive circuit is completed, the inductor begins storing energy in its magnetic fields. When the same circuit is broken, the energy in the magnetic field is quickly reconverted into electrical energy.

How do you find the energy stored in an inductor?

The energy, stored within this magnetic field, is released back into the circuit when the current ceases. The energy stored in an inductor can be quantified by the formula  $W = \frac{1}{2} L I^2$ , where  $W$  is the energy in joules,  $L$  is the inductance in henries, and  $I$  is the current in amperes.
