Energy storage is an effective method for storing energy produced from renewable energy stations during off-peak periods, when the energy demand is low [1] fact, energy storage is turning out nowadays to be an essential part of renewable energy systems, especially as the technology becomes more efficient and renewable energy resources increase.

"The desalination industry itself uses quite a lot of it," Kumar says of sodium hydroxide. "They're buying it, spending money on it. So if you can make it in situ at the plant, that could be a big advantage." The amount needed in the plants themselves is far less than the total that could be produced from the brine, so there is also potential for it to be a saleable product.
