Hot water thermal energy storage (HWTES): This established technology, which is widely used on a large scale for seasonal storage of solar thermal heat, stores hot water (a commonly used storage material because of its high specific heat) inside a concrete structure, which is wholly or partially buried in the ground, to increase the insulation of the hot water [].

The concept of seasonal thermal energy storage (STES), which uses the excess heat collected in summer to make up for the lack of heating in winter, is also known as long-term thermal storage [4]. Seasonal thermal energy storage was proposed in the United States in the 1960s, and research projects were carried out in the 1970s.
