Energy is everywhere, affecting everything, all the time. And it can be manipulated and converted into the kind of energy that we depend on as a civilization. But transforming this ambient energy (the result of gyrating atoms and molecules) into something we can plug into and use when we need it requires specific materials.

The limitations of TESM can be eliminated blending with any suitable additive (such as nanoparticles), materials to form composite thermal energy storage materials (CTESM), which allows the material to increase the storage capacity by enhancing their thermophysical properties. 3.2.2 Types of Thermal Energy Storage
