In comparison, the mobile phone draws continuous high current from a small battery when transmitting and crunching data. This puts more stress on a mobile phone battery than driving an EV. A battery is also negatively impacted by the pulsed load of a mobile phone rather than the DC load of an EV. (See BU-501: Basic about Discharging.)

A mobile phone battery needs high capacity and reasonably good specific power. These are two unique attributes that cannot be put into one product without compromise. An analogy is political parties that pursue different mandates and must make a compromise. In the battery, specific energy is responsible for runtimes and specific power for current.

For over a century, battery technology has advanced, enabling energy storage to power homes, buildings, and factories and support the grid. The capability to supply this energy is accomplished through Battery Energy Storage Systems (BESS), which utilize lithium-ion and lead acid batteries for large-scale energy storage.
