What is the discharge capacity of 2 mL of LII & LiFePO₄?

When the electrolyte volume is considered, 2 ml of catholyte composed of 10 mM LiI and 6.4 mg LiFePO₄ (20 mM equivalent concentration) demonstrated a discharge capacity of ~ 0.8 mAh in the first cycle. Lithium metal with aqueous catholytes.

For an energy storage technology, the stored energy per unit can usually be assessed by gravimetric or volumetric energy density. The volumetric energy storage density, which is widely used for LAES, is defined as the total power output or stored exergy divided by the required volume of storage parts (i.e., liquid air tank).

A comparative overview of large-scale battery systems for electricity storage. Andreas Poullikkas, in Renewable and Sustainable Energy Reviews, 2013. 2.5 Flow batteries. A flow battery is a form of rechargeable battery in which electrolyte containing one or more dissolved electro-active species flows through an electrochemical cell that converts chemical energy directly to electricity.
