A flywheel is a rotating mechanical device that is used to store rotational energy that can be called up instantaneously. At the most basic level, a flywheel contains a spinning mass in its center that is driven by a motor - and when energy is needed, the spinning force drives a device similar to a turbine to produce electricity, slowing the rate of rotation.

There are three main types of MES systems for mechanical energy storage: pumped hydro energy storage (PHES), compressed air energy storage (CAES), and flywheel energy storage (FES). Each system uses a different method to store energy, such as PHES to store energy in the case of GES, to store energy in the case of gravity energy stock, to store ...
