

Planet name

The red planet got its name from the Roman god of war whose Greek equivalent is Ares. It has two satellites--the most moons of any terrestrial planet. Phobos and Deimos have irregular shapes. They are named after the sons of Ares (Mars) in Greek mythology. Mars Fast Facts. Distance: 227,940,000 km (141,635,349 mi) Radius: 3,400 km (2,113 mi)

Introduction. The planetary system we call home is located in an outer spiral arm of the Milky Way galaxy. Our solar system consists of our star, the Sun, and everything bound to it by gravity - the planets Mercury, Venus, Earth, Mars, Jupiter, Saturn, Uranus, and Neptune; dwarf planets such as Pluto; dozens of moons; and millions of asteroids, comets, and meteoroids.

Names of all the Planets of the Solar System. This page shows the names of all the planets and also the names of the currently known moons. It also lists the names and locations of each Planet and Satellite discoverer (if known) and provides the meaning/derivation for each name. The planets are in order of the date of discovery.

A planet is any of the large bodies that orbit the Sun, including Mercury, Venus, Earth, Mars, Jupiter, Saturn, Uranus, and Neptune, in order of closeness to the Sun. Mercury. Mercury is the first of the four terrestrial planets. This means it is a planet made mostly of rock. The planets closest to the Sun--Venus, Earth, and Mars--are the ...

Learn about the eight planets in our solar system, their sizes, types, orbits and features. Find out how the solar system formed, what is a planet, and whether there is a Planet Nine.

Planet Naming Rules. Creating a realistic planet name for your sci-fi novel is not as simple as naming a fantasy character or coming up with a forest name. There's a couple of rules created by the International Astronomical Union (IAU) that one must follow. For those who are unfamiliar the IAU is the official group that oversees new discoveries in space, including planets, stars, ...

The IAU's names for exoplanets - and on most occasions their host stars - are chosen by the Executive Committee Working Group (ECWG) on Public Naming of Planets and Planetary Satellites, a group working parallel with the Working Group on Star Names (WGSN). [1] Proper names of stars chosen by the ECWG are explicitly recognised by the WGSN. [1] The ECWG's ...

A planet is a large, rounded astronomical body that is neither a star nor its remnant. The best available theory of planet formation is the nebular hypothesis, which posits that an interstellar cloud collapses out of a nebula to create a young protostar orbited by a protoplanetary disk. ... List of proper names of exoplanets; List of largest ...

Planet name

The names of the planets in the solar system are Mercury, Venus, Earth, Mars, Jupiter, Saturn, Uranus, and Neptune. These eight planets orbit the Sun and vary in terms of size, composition, and ...

The order and arrangement of the planets and other bodies in our solar system is due to the way the solar system formed. Nearest to the Sun, only rocky material could withstand the heat when the solar system was young. For this reason, the first four planets - Mercury, Venus, Earth, and Mars - are terrestrial planets.

From the first launches in the late 1950s until today, we've sent probes, orbiters, landers, and even rovers (like NASA's Perseverance Rover that touched down on Mars in February 2021) to every planet in our solar system. But can you name all eight of those planets in order? (Yes, there are only eight - not nine. Pluto got "demoted" in 2006 ...

The eight planets of the Solar System with size to scale (up to down, left to right): Saturn, Jupiter, Uranus, Neptune (outer planets), Earth, Venus, Mars, and Mercury (inner planets). A planet is a large, rounded astronomical body that is generally required to be in orbit around a star, stellar remnant, or brown dwarf, and is not one itself. [1] The Solar System has eight planets by the ...

Learn about the eight planets of the solar system and some of the extrasolar planets discovered by astronomers. Find out their names, characteristics, and orbits around the Sun or other stars.

Planet Nine or Planet 9 is the temporary name of an undiscovered planet whose existence is predicted based on the gravitational effects on bodies at the extreme edge of the solar system. According to these effects, some astronomers estimate the undiscovered planet is about the same size as Neptune. If it exists, Planet Nine could be a captured ...

The Solar System [d] is the gravitationally bound system of the Sun and the objects that orbit it. [11] It formed about 4.6 billion years ago when a dense region of a molecular cloud collapsed, forming the Sun and a protoplanetary disc. The Sun is a typical star that maintains a balanced equilibrium by the fusion of hydrogen into helium at its core, releasing this energy from its ...

A star that hosts planets orbiting around it is called a planetary system, or a stellar system, if more than two stars are present. Our planetary system is called the Solar System, referencing the name of our Sun, and it hosts eight planets.. The eight planets in our Solar System, in order from the Sun, are the four terrestrial planets Mercury, Venus, Earth, and Mars, followed by the two gas ...

Planet and Satellite Names and Discoverers. This page shows information about planetary bodies named by the IAU Working Group for Planetary System Nomenclature (WGPSN), and about bodies named by the IAU Committee on Small Body Nomenclature that have surface features named by the WGPSN. The IAU ...

To help you on your way, I've compiled a list of planet name ideas to help you create your next fantasy world. Whether crafting a sci-fi epic set in a Star Wars universe, seeking a planet name generator for your next game,

or ...

Learn about the eight planets and five dwarf planets in our solar system, their features, moons, and history. Find detailed information, questions, and buyer's guides for ...

Alien Planet Names . Alien planet names are crafted to feel unfamiliar and otherworldly, often using unusual sounds and structures to evoke a sense of the unknown. These new names spark the imagination of distant, mysterious worlds. Xenthor: A barren planet where spiky, crystalline structures dominate the landscape, with an atmosphere thick with neon gases.

The planets in our solar system were named after Roman gods. Mercury is the Roman god of travel and commerce, Venus is the Roman goddess of love and beauty, Mars is the Roman god of war, Jupiter is the king of all Roman gods, Saturn is the Roman god of agriculture and wealth, and Uranus is the Greek god of the heavens.

The small planets have diameters less than 13000 km. giant planets: Jupiter, Saturn, Uranus and Neptune. The giant planets have diameters greater than 48000 km. The giant planets are sometimes also referred to as gas giants. by position relative to the Sun: inner planets: Mercury, Venus, Earth and Mars. outer planets: Jupiter, Saturn, Uranus ...
