What is compressed air energy storage?
Compressed-air energy storage (CAES) is a way to store energy for later use using compressed air. At a utility scale,energy generated during periods of low demand can be released during peak load periods. The first utility-scale CAES project was in the Huntorf power plant in Elsfleth,Germany,and is still operational as of 2024.

The compressed air storages built above the ground are designed from steel. These types of storage systems can be installed everywhere, and they also tend to produce a higher energy density. The initial capital cost for above- the-ground storage systems are very high.

How many kW can a compressed air energy storage system produce?
CAES systems are categorised into large-scale compressed air energy storage systems and small-scale CAES. The large-scale is capable of producing more than 100MW,while the small-scale only produce less than 10 kW. The small-scale produces energy between 10 kW - 100MW .
