The water pump is interrupted when the ice making equipment is ...

Process of Freezing. Freezing is a physical process by which the temperature of a material is reduced below its freezing point temperature. Two heat energy principles are involved: sensible heat and latent heat. When the material is at a temperature above its freezing point, first the sensible heat is removed until the material reaches its freezing point; second, the ...

Where (\overline{C}_p) is the average specific heat of the storage material within the temperature range. Note that constant values of density ρ (kg.m⁻³) are considered for the majority of storage materials applied in buildings. For packed bed or porous medium used for thermal energy storage, however, the porosity of the material should also be taken into account.

Current ice-storage technology can be separated into two distinct categories: dynamic ice storage and static ice storage according to ice energy storage. And the later one can be divided into external melt ice-on coil storage system and internal melt ice-on coil storage system. It is shown in figure 1 ice-storage technology dynamic ice storage

The ice maker machine is a kind of refrigeration mechanical equipment that produces ice after the water passes through the evaporator and is cooled by the refrigeration system refrigerant.
