What are resonant converter topologies?

They have been successfully applied to constant current power sources [14-19]. The basic resonant converter topologies are series resonant and parallel resonant converters with inductor (L) and capacitor (C) as reactive elements. The draw backs of series resonant converter are poor part load and no-load regulation.

So the LCC resonant converter of topology T5 is found to be suitable for constant current source. Fig.5c. Current gain plot of topology T11 Resonant converter size depends on the size of the reactive components.
