The analysis indicates that implementing distributed shared energy storage enables SESO to reach profitability and recover investment costs within 5.33 years. EC can also slightly reduce their electricity costs while gaining access to two or more energy storage devices for dynamic backup.

How to constrain the capacity power of distributed shared energy storage?

To constrain the capacity power of the distributed shared energy storage, the big-M method is employed by multiplying $U_{e s, i p o s}(t)$ by a sufficiently large integer M . (5) $P_{e s, i m i n} U_{e s, i p o s} \leq P_{e s, i m a x} \leq M U_{e s, i p o s}$ $E_{e s, i m i n} U_{e s, i p o s} \leq E_{e s, i m a x} \leq M U_{e s, i p o s}$
