What are the 8 planets in the Solar System?

The eight planets in the solar system are: Mercury, Venus, Earth, Mars, Jupiter, Saturn, Uranus, and Neptune. The four inner planets, Mercury, Venus, Earth, and Mars, are called the terrestrial planets because they are mostly made of rock and metal.

Where is the Solar System located?

The solar system is located in the Milky Way's Orion star cluster. Only 15% of stars in the galaxy host planetary systems, and one of those stars is our own sun. Revolving around the sun are eight planets. The planets are divided into two categories based on their composition, terrestrial and Jovian.

Is the Solar System a galaxies?

The solar system itself is only a small part of a huge system of stars and other objects called the Milky Way galaxy. The solar system orbits around the center of the galaxy about once every 225 million years. The Milky Way galaxy is just one of billions of galaxies that in turn make up the universe.

How did humans learn about the Solar System?

Humanity's knowledge of the Solar System has grown incrementally over the centuries. Up to the Late Middle Ages - Renaissance, astronomers from Europe to India believed Earth to be stationary at the center of the universe [280] and categorically different from the divine or ethereal objects that moved through the sky.
