Subgrade reaction modulus is the ratio of soil pressure to deflection. This modulus is widely used in structural design of mats and slabs. 2.4.2. Atterberg Limits. The Atterberg limits are a basic measure of the nature of a fine-grained soil depending on the water content of the soil, it may appear in four states: solid, semi-solid, plastic and liquid. In each state the consistency and behavior of a soil is different and thus so are its engineering properties.

(8) for storage modulus, due to the superior loss modulus of samples compared to elastic modulus at the same frequency. These evidences establish that the viscous parts of polymers are stronger than the elastic ones in the prepared samples. Indeed, the loss modulus of samples predominates the storage modulus during frequency sweep.

Depending on the retardation of the sample's shear stress reaction, viscous and elastic strain proportions are defined with the help of storage and loss modulus (G' and G''), ...

The ratio of the loss modulus to storage modulus in a viscoelastic material is defined as the $\tan \delta$, (cf. loss tangent), which provides a measure of damping in the material. $\tan \delta$ can also be visualized as the tangent of the phase angle between the storage and loss modulus. Tensile: $\tan \delta = \frac{E''}{E'}$ Shear: $\tan \delta = \frac{G''}{G'}$ For a material with a $\tan \delta$ greater than 1, the energy-dissipating, viscous ...

Soil Sub-Grade Modulus Subgrade-Subbase Strength Soil bearing capacity, soil compressibility, and soil modulus of subgrade reaction are various measures of strength-deformation properties of soil. It is important to consider how these parameters apply to the design of floor slabs.

The modulus of subgrade reaction k_s (also called the coefficient of subgrade reaction of soil) is the ratio of the pressure against a flat surface on soil and the settlement at that point. Mathematically, this is expressed as; $k_s = \frac{q}{d}$ ----- (1). Where; k_s = Coefficient of subgrade reaction expressed in force/length² /length q = pressure on the surface at the given ...

One of the key issues in structural and geotechnical engineering is that most parts of buildings are usually analysed separately and then the outputs are used in foundation designs. In this process, some effects are neglected. In this study, the soil-structure interaction (SSI) in foundations of concrete buildings was evaluated using the direct finite element method ...

The Modulus of Subgrade Reaction is a measure of a soils stiffness. It is an indicator of a soils resultant unit displacement under a given pressure. The units of Modulus of Subgrade Reaction are often expressed as kPa/mm, MPa/mm or pci (kilopascal per millimetre, megapascal per millimetre and pound per cubic inch respectively).
