LTOs have a lower energy density, which means they need more cells to provide the same amount of energy storage, which makes them an expensive solution. For example, while other battery types can store from 120 to 500 watt-hours per kilogram, LTOs store about 50 to 80 watt-hours per kilogram. What makes a good battery for energy storage systems

They are being actively researched and developed to overcome challenges such as lower energy density and shorter lifespan compared to lithium-ion batteries. Sodium-ion batteries show promise for applications where cost-effectiveness and environmental sustainability are priorities, such as grid storage and large-scale energy storage systems.

vehicles is due to the mass compounding effect of the energy storage system. Each kg of energy storage on the vehicle results in a 1.3-1.7 kg increase in vehicle mass, due to the additional powerplant and structure required to suspend and transport it (Mitlitsky 1999-e). Large mass fractions devoted to energy storage ruin a vehicle design ...
