Lithium-ion Battery. A lithium-ion battery, also known as the Li-ion battery, is a type of secondary (rechargeable) battery composed of cells in which lithium ions move from the anode through an electrolyte to the cathode during discharge and back when charging. The cathode is made of a composite material (an intercalated lithium compound) and defines the name of the Li-ion ...

Lastly, lithium titanate batteries, or LTO, are unique lithium-ion batteries that use titanium in their makeup. While LTO batteries are very safe, high performing, and long-lasting, their high upfront cost has prevented them from becoming a more common option in all types of storage applications. Compared to other lithium-ion battery ...

Lithium cobalt acid battery is a type of lithium-ion battery. There are also lithium manganate, lithium ternary, and lithium iron phosphate batteries. Among them, the lithium cobalt acid battery is best at charging. It has a stable structure, holds a lot of power, and works really well. But, it's not very safe and costs a lot.

The different lithium battery types get their names from their active materials. For example, the first type we will look at is the lithium iron phosphate battery, also known as LiFePO4, based on the chemical symbols for the active materials. However, many people shorten the name further to simply LFP.

The term lithium-ion points to a family of batteries that shares similarities, but the chemistries can vary greatly. Li-cobalt, Li-manganese, NMC and Li-aluminum are similar in that they deliver high capacity and are used in portable applications. Li-phosphate and Li-titanate have lower voltages and have less capacity, but are very durable.
