

What is the purpose of Flywheel energy storage?

The primary purpose of the flywheel energy storage will be to increase the inertia of the power system. Wind turbines will never be able to act as primary reserve power plants, as the amount of energy that can be stored in a wind turbine is not sufficient for that.

The main feature of flywheel energy storage systems (FESS) generally is that they can be charged and discharged at high power for many chargedischarge cycles.

How much energy can a flywheel store?

A flywheel constructed by Urenco Power Technologies (UPT) (Tarrant, 1998) using the filament wind process had a cylindrical rotor of mass 110 kg, and energy storage capacity of 2 kW h when operated at up to 37 800 rev/min. The construction of this flywheel is shown in Fig. 11.2.

Can flywheel energy storage be used inside a wind turbine rotor?

Increasing ω_{ref} and hence ω_{rot} to 1.2 pu still leads to $P_{grid} = 1$ pu, but the additional aerodynamic power can be used to drive the flywheel weights to R_{fw_max} . In this paper, a flywheel energy storage inside a wind turbine rotor is proposed.

The main problem of the wind power is its stochastic availability. The pulsation of the wind speed causes power pulsation, resulting in deterioration of the power quality. To compensate it, energy storage is necessary. Considering the wind spectrum, different storage systems can be used for the different frequencies of the wind speed variation. The short time turbulent power pulsation ...
