Iron-based flow batteries designed for large-scale energy storage have been around since the 1980s, and some are now commercially available. What makes this battery different is that it stores energy in a unique liquid chemical formula that combines charged iron with a neutral-pH phosphate-based liquid electrolyte, or energy carrier.

Savinell and his team at CWRU are working on a prototype decoupled iron-flow battery to store power generated from grid-scale wind and solar facilities in a scalable and cost-efficient manner. "When renewable energy reaches approximately 15 to 20% of total power generation, utility-scale storage is required," says Savinell.

The answer is in batteries, and other forms of energy storage. Demand for power is constantly fluctuating. As a result, it's not uncommon to have periods of time when conditions for solar and wind energy generation allow us to draw far more power from these natural sources than the grid demands in that moment.

As with any new technology, iron-air batteries will need to be demonstrated and scaled up to drive costs down. At commercial scale, Form expects its iron-air batteries to store electricity at less than 1/10 the cost of lithium-ion batteries. Form Energy has received support from both DOE and private investors to develop and scale its technology.
